# OptiLight IPL Hair Removal

Hassle free. Worry free.

# Why IPL Hair Removal?

A clinically validated treatment that will reduce hair growth for:

Bikini

Legs

Underarms

Body

resulting in smooth, beautiful skin.

# What should I expect?

## When will I see results?

The OptiLIGHT IPL Hair Removal treatment is generally administered in a series of four to six sessions that yield excellent long-term results. Significant hair reduction is already visible after the first session.

## What can I expect after treatment?

Immediately after treatment, you may experience some slight redness or swelling of the treated area. This is a positive clinical result which indicates that the follicles have responded to the treatment. You should be able to resume normal activities immediately after treatment. Typically your physician should advise to stay out of direct sun for a few weeks following the treatment and to apply sun screen.

# What is it?

## The OptiLIGHT IPL Hair Removal solution

The OptiLIGHT IPL Hair Removal treatment is a non-invasive treatment that reduces hair growth, resulting in smooth, beautiful skin.

Our unique IPL (Intense Pulsed Light) technology targets the hair follicles, and impairs their ability to grow hair. IPL hair removal is effective on black, brown and red hair.

## Is It right for me?

OptiLIGHT treatments are not suitable for everyone and may carry some risks. IPL hair removal is not suitable when you have active infections, viral, fungal or bacterial diseases, inflammatory skin conditions or skin cancer. Risks may include: redness, swelling, scarring or a change of pigmentation. Be sure to consult with your treatment provider before choosing this treatment.

# How does it work?

## IPL Hair Removal technology

Highly controlled pulses of light are applied on the treated area and are selectively absorbed by the hair follicles beneath the skin surface. The absorbed light heats the hair follicles, which damages the re-growth potential of the follicle – all without damaging the surrounding tissue.

## The treatment

Before treatment, your clinician should closely shave away the hair in the treated areas and apply a cold gel. As the pulses of light are applied to your skin, you may feel a slight stinging or warm sensation. When the gel is removed, much of the hair is wiped off with it. The remaining hair in the treated area sheds over the next week or two.

During Treatment Pigment in hair shaft absorbs the light. The resulting heat damages each follicle.

Intense pulses of light are delivered through the lightguide with integrated cooling to ensure maximum comfort.
